

# Florida's Water Planning Challenges

- Does the current system provide **sufficient information** for policymakers, regulators and the public to understand **current and future** demand and supply for water resources?
- Do water consumers receive, and respond to, the **'right' price signals**?
- Can **cooperation** between local and regional governmental authorities improve the **efficiency and fairness** of planning and delivering water supplies?
- Can existing **environmental safeguards** for water resources sustain the ecosystems and human uses that depend on these resources?
